# Convex sets and affine sets

## Definition 1: Convex set

A set  $\mathcal{C}$  is a **convex set**, if and only if  $\forall \mathbf{x}_1 \in \mathcal{C}, \mathbf{x}_2 \in \mathcal{C}, \forall \theta \in [0,1]$ , we have,

$$\theta \mathbf{x}_1 + (1 - \theta) \mathbf{x}_2 \in \mathcal{C}$$

$\theta \mathbf{x}_1 + (1 - \theta) \mathbf{x}_2 \in \mathcal{C}$  is also called the **convex combination** of  $\mathbf{x}_1$  and  $\mathbf{x}_2$

If a set is convex, the line segment linking any two points in that set also belongs to that set

convex

not convex

not convex

## Convex sets and affine sets

### Proposition 1:

If  $\mathcal{C}_1$  and  $\mathcal{C}_2$  are two convex sets, their intersection  $\mathcal{C}_1 \cap \mathcal{C}_2$  is also a convex set

An example

## Convex sets and affine sets

### Definition 2: Affine set

A set  $\mathcal{C}$  is an **affine set**, if and only if  $\forall \mathbf{x}_1 \in \mathcal{C}, \mathbf{x}_2 \in \mathcal{C}, \forall \theta \in \mathbb{R}$ , we have,

$$\theta \mathbf{x}_1 + (1 - \theta) \mathbf{x}_2 \in \mathcal{C}$$

$\theta \mathbf{x}_1 + (1 - \theta) \mathbf{x}_2 \in \mathcal{C}$  is also called the **affine combination** of  $\mathbf{x}_1$  and  $\mathbf{x}_2$

If a set is affine, the line passing any two points in that set also belongs to that set

## Convex sets and affine sets

### Definition 3: Affine hull

The set of all the affine combinations of points in set  $\mathcal{C}$  is called the **affine hull** of  $\mathcal{C}$ , denoted by  $\mathbf{aff}\mathcal{C}$ ,

$$\mathbf{aff}\mathcal{C} = \{\theta \mathbf{x}_1 + (1 - \theta) \mathbf{x}_2 \mid \mathbf{x}_1, \mathbf{x}_2 \in \mathcal{C}\}$$

where  $\theta \in \mathbb{R}$  is any number

No matter whether  $\mathcal{C}$  is affine or not, its affine hull  $\mathbf{aff}\mathcal{C}$  is an affine set

$\mathbf{aff}\mathcal{C}$  is the smallest affine set that contains  $\mathcal{C}$ ; if  $\mathcal{C}$  is an affine set,  $\mathbf{aff}\mathcal{C} = \mathcal{C}$

Examples: what are the affine hulls for the following sets?

## Convex sets and affine sets

### Definition 4: **interior**, **closure**, **boundary**, and **open set**

For a set  $\mathcal{C} \subseteq \mathbb{R}^n$ , we can define its **interior** and **boundary** (relative to  $\mathbb{R}^n$ )

The interior of  $\mathcal{C}$  is defined as,  $\text{int}\mathcal{C} = \{\mathbf{x} \in \mathcal{C} \mid \exists \varepsilon > 0, B(\mathbf{x}, \varepsilon) \subseteq \mathcal{C}\}$

where  $B(\mathbf{x}, \varepsilon) = \{\mathbf{y} \in \mathbb{R}^n \mid \|\mathbf{y} - \mathbf{x}\| \leq \varepsilon\}$ , and  $\|\cdot\|$  can be any norm

The closure of  $\mathcal{C}$  is defined as,  $\text{cl}\mathcal{C} = \{\mathbf{x} \in \mathbb{R}^n \mid \forall \varepsilon > 0, \exists \mathbf{y} \in \mathcal{C}, \|\mathbf{y} - \mathbf{x}\| \leq \varepsilon\}$

The boundary of  $\mathcal{C}$  is defined as,  $\text{bc}\mathcal{C} = \text{cl}\mathcal{C} \setminus \text{int}\mathcal{C}$

The set  $\mathcal{C}$  is an open set if and only if  $\text{int}\mathcal{C} = \mathcal{C}$

## Convex sets and affine sets

---

In  $\mathbb{R}^3$ , what are the interiors and boundaries for a solid sphere and a thin paper?

## Convex sets and affine sets

**Definition 5:** For a set  $\mathcal{C} \subseteq \mathbb{R}^n$ , its **relative** (to its affine hull) **interior** is defined as,

$$\text{relint}\mathcal{C} = \left\{ \mathbf{x} \in \mathcal{C} \mid \exists \varepsilon > 0, \text{ such that } (B(\mathbf{x}, \varepsilon) \cap \text{aff}\mathcal{C}) \subseteq \mathcal{C} \right\}$$

where  $B(\mathbf{x}, \varepsilon) = \left\{ \mathbf{y} \in \mathbb{R}^n \mid \|\mathbf{y} - \mathbf{x}\| \leq \varepsilon \right\}$ , and  $\|\cdot\|$  can be any norm

For a set  $\mathcal{C} \subseteq \mathbb{R}^n$ , its **relative** (to its affine hull) **boundary** is defined as,

$$\text{cl}\mathcal{C} \setminus \text{relint}\mathcal{C}$$

**Proposition 2:**

For a set  $\mathcal{C} \subseteq \mathbb{R}^n$ , if  $\text{aff}\mathcal{C} = \mathbb{R}^n$ , then  $\text{relint}\mathcal{C} = \text{int}\mathcal{C}$  and  $\text{cl}\mathcal{C} \setminus \text{relint}\mathcal{C} = \text{bd}\mathcal{C}$

## Convex sets and affine sets

**Example:** Consider a square in the  $(x_1, x_2)$ -plane in  $\mathbb{R}^3$ , defined as,

$$\mathcal{C} = \{\mathbf{x} \in \mathbb{R}^3 \mid -1 \leq x_1 \leq 1, -1 \leq x_2 \leq 1, x_3 = 0\}$$

Its affine hull is the  $(x_1, x_2)$ -plane, i.e.,  $\mathbf{aff}\mathcal{C} = \{\mathbf{x} \in \mathbb{R}^3 \mid x_3 = 0\}$

The interior of  $\mathcal{C}$  is empty, but its relative interior is,

$$\mathbf{relint}\mathcal{C} = \{\mathbf{x} \in \mathbb{R}^3 \mid -1 < x_1 < 1, -1 < x_2 < 1, x_3 = 0\}$$

The boundary of  $\mathcal{C}$  is itself, but its relative boundary is the wire-frame outline,

$$\mathbf{cl}\mathcal{C} \setminus \mathbf{relint}\mathcal{C} = \{\mathbf{x} \in \mathbb{R}^3 \mid \max\{|x_1|, |x_2|\} = 1, x_3 = 0\}$$

# Convex functions

## Definition 6: Affine function

If the function  $\mathbf{f}(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}^m$  is the sum of a linear function and a constant, it is called an **affine function**, i.e., it has the form,

$$\mathbf{f}(\mathbf{x}) = \mathbf{A}\mathbf{x} + \mathbf{b}, \mathbf{A} \in \mathbb{R}^{m \times n}, \mathbf{x} \in \mathbb{R}^{n \times 1}, \mathbf{b} \in \mathbb{R}^{m \times 1}$$

# Convex functions

## Definition 7: Convex function

A function  $f(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}$  is **convex** if its domain  $\text{dom}f$  is a convex set, and if for all  $\mathbf{x}, \mathbf{y} \in \text{dom}f$  and any  $\theta \in [0, 1]$ , we have,

$$\theta f(\mathbf{x}) + (1 - \theta)f(\mathbf{y}) \geq f(\theta\mathbf{x} + (1 - \theta)\mathbf{y}) \quad (\text{Eq. 1})$$

A typical convex function in 2D

## Definition 8: Strictly Convex function

In Def. 7, if Eq. 1 changes to,

$$\theta f(\mathbf{x}) + (1 - \theta)f(\mathbf{y}) > f(\theta\mathbf{x} + (1 - \theta)\mathbf{y})$$

and all the other conditions remain, then the function  $f(\mathbf{x})$  is called **strictly convex**

## Convex functions

### **Definition 9:** Concave function

If  $-f(\mathbf{x})$  is a convex function, we say  $f(\mathbf{x})$  is a **concave function**

### **Definition 10:** Strictly concave function

If  $-f(\mathbf{x})$  is a strictly convex function, we say  $f(\mathbf{x})$  is a **strictly concave function**

# Convex functions

## Proposition 3:

A function is convex if and only if it is convex when restricted to any line that intersects its domain. In other words,  $f$  is convex if and only if for all  $\mathbf{x} \in \text{dom} f$  and all  $\mathbf{v}$ , the function  $g(t) = f(\mathbf{x} + t\mathbf{v})$  is convex on its domain  $\{t \mid \mathbf{x} + t\mathbf{v} \in \text{dom} f\}$

# Convex functions

## Proposition 4:

The affine function is a convex function and also is a concave function.

*How to prove?*

# Convex functions

**Proposition 5:** First-order conditions to determine a convex function

Suppose  $f(\mathbf{x})$  is differentiable. Then,  $f(\mathbf{x})$  is convex if and only if  $\text{dom}f$  is convex and

$$f(\mathbf{y}) \geq f(\mathbf{x}) + (\nabla f(\mathbf{x}))^T (\mathbf{y} - \mathbf{x})$$

holds for all  $\mathbf{x}, \mathbf{y} \in \text{dom}f$

For a formal proof, refer to the textbook

## Convex functions

**Proposition 6:** First-order conditions to determine a strictly convex function

Suppose  $f(\mathbf{x})$  is differentiable. Then,  $f(\mathbf{x})$  is strictly convex if and only if  $\mathbf{dom}f$  is convex and

$$f(\mathbf{y}) > f(\mathbf{x}) + (\nabla f(\mathbf{x}))^T (\mathbf{y} - \mathbf{x})$$

holds for all  $\mathbf{x}, \mathbf{y} \in \mathbf{dom}f$

# Convex functions

## Proposition 7:

Suppose that  $f(\mathbf{x})$  is a differentiable convex function. If  $\mathbf{x}_0$  is a stationary point of  $f(\mathbf{x})$ , i.e.,  $\nabla_{\mathbf{x}=\mathbf{x}_0} f(\mathbf{x}) = \mathbf{0}$ ,  $\mathbf{x}_0$  is a global minimizer of  $f(\mathbf{x})$

Proof:

$f(\mathbf{x})$  is convex and differentiable, according to Prop. 5,

$$\forall \mathbf{x}, \mathbf{y} \in \text{dom} f, \quad f(\mathbf{y}) \geq f(\mathbf{x}) + (\nabla f(\mathbf{x}))^T (\mathbf{y} - \mathbf{x})$$

$$\text{At } \mathbf{x} = \mathbf{x}_0, \quad f(\mathbf{y}) \geq f(\mathbf{x}_0) + (\nabla_{\mathbf{x}=\mathbf{x}_0} f(\mathbf{x}))^T (\mathbf{y} - \mathbf{x}_0)$$

Since  $\nabla_{\mathbf{x}=\mathbf{x}_0} f(\mathbf{x}) = \mathbf{0}$

$$f(\mathbf{y}) \geq f(\mathbf{x}_0) \longrightarrow \mathbf{x}_0 \text{ is a global minimizer of } f(\mathbf{x})$$

## Convex functions

### Proposition 8: Second-order conditions to determine a convex function

Suppose  $f(\mathbf{x})$  is twice differentiable. Then,  $f(\mathbf{x})$  is convex if and only if  $\text{dom}f$  is convex and the Hessian matrix  $\nabla^2 f(\mathbf{x})$  is positive semidefinite for all  $\mathbf{x} \in \text{dom}f$

必要性。我们需要证明：若  $f(\mathbf{x})$  是凸函数，则它的定义域是凸集并且它的海森矩阵  $\nabla^2 f(\mathbf{x})$  为半正定矩阵。由于  $f(\mathbf{x})$  是凸函数，根据凸函数定义， $\text{dom}f$  必然为凸集。由于  $f(\mathbf{x})$  二阶可微， $\forall \mathbf{x} \in \text{dom}f$ ，我们可在  $\mathbf{x}$  处进行二阶泰勒展开，有，

$$f(\mathbf{x} + \mathbf{h}) = f(\mathbf{x}) + \mathbf{h}^T \nabla f(\mathbf{x}) + \frac{1}{2} \mathbf{h}^T \nabla^2 f(\mathbf{x}) \mathbf{h} + O(\|\mathbf{h}\|^2)$$

其中， $\mathbf{h} \neq \mathbf{0}$ 。由于已知  $f(\mathbf{x})$  为凸函数，根据 prop. 5 可知， $f(\mathbf{x} + \mathbf{h}) \geq f(\mathbf{x}) + \nabla^T f(\mathbf{x}) \mathbf{h}$ 。结

合上式有  $\frac{1}{2} \mathbf{h}^T \nabla^2 f(\mathbf{x}) \mathbf{h} \geq 0$ ，因此  $\nabla^2 f(\mathbf{x})$  为半正定矩阵。

## Convex functions

### Proposition 8: Second-order conditions to determine a convex function

Suppose  $f(\mathbf{x})$  is twice differentiable. Then,  $f(\mathbf{x})$  is convex if and only if  $\text{dom}f$  is convex and the Hessian matrix  $\nabla^2 f(\mathbf{x})$  is positive semidefinite for all  $\mathbf{x} \in \text{dom}f$

充分性。我们需要证明：若  $f(\mathbf{x})$  的定义域是凸集并且它的海森矩阵  $\nabla^2 f(\mathbf{x})$  为半正定矩阵，则  $f(\mathbf{x})$  必为凸函数。  $\forall \mathbf{x}, \mathbf{y} \in \text{dom}f$ ，根据泰勒展开有，

$$f(\mathbf{y}) = f(\mathbf{x}) + \nabla^T f(\mathbf{x})(\mathbf{y} - \mathbf{x}) + \frac{1}{2}(\mathbf{y} - \mathbf{x})^T \nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))(\mathbf{y} - \mathbf{x})$$

其中， $t \in [0, 1]$  是存在的某个数能使上式成立。由于  $\text{dom}f$  为凸集，根据凸集的性质可知

$\mathbf{x} + t(\mathbf{y} - \mathbf{x}) \in \text{dom}f$ 。根据已知条件， $f(\mathbf{x})$  在其定义域内任意一点处的海森矩阵都为半正定矩

阵，则  $\nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))$  为半正定矩阵，则  $\frac{1}{2}(\mathbf{y} - \mathbf{x})^T \nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))(\mathbf{y} - \mathbf{x}) \geq 0$ 。再结合上述泰

勒展开结果可知， $f(\mathbf{y}) \geq f(\mathbf{x}) + \nabla^T f(\mathbf{x})(\mathbf{y} - \mathbf{x})$ 。根据 prop. 5 可知， $f(\mathbf{x})$  为凸函数。

## Convex functions

### Proposition 9: Second-order conditions to determine a strictly convex function

Suppose  $f(\mathbf{x})$  is twice differentiable. If  $\text{dom}f$  is convex and  $\nabla^2 f(\mathbf{x})$  is positive definite for all  $\mathbf{x} \in \text{dom}f$ , then  $f(\mathbf{x})$  is strictly convex

证明:

$\forall \mathbf{x}, \mathbf{y} \in \text{dom}f$ , 根据泰勒展开有,

$$f(\mathbf{y}) = f(\mathbf{x}) + \nabla^T f(\mathbf{x})(\mathbf{y} - \mathbf{x}) + \frac{1}{2}(\mathbf{y} - \mathbf{x})^T \nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))(\mathbf{y} - \mathbf{x})$$

其中,  $t \in [0,1]$  是存在的某个数能使上式成立。由于  $\text{dom}f$  为凸集, 根据凸集的性质可知

$\mathbf{x} + t(\mathbf{y} - \mathbf{x}) \in \text{dom}f$ 。根据已知条件,  $f(\mathbf{x})$ 在其定义域内任意一点处的海森矩阵都为正定矩阵,

则  $\nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))$  为正定矩阵, 则  $\frac{1}{2}(\mathbf{y} - \mathbf{x})^T \nabla^2 f(\mathbf{x} + t(\mathbf{y} - \mathbf{x}))(\mathbf{y} - \mathbf{x}) > 0$ 。结合泰勒展开结果则

有,  $f(\mathbf{y}) > f(\mathbf{x}) + \nabla^T f(\mathbf{x})(\mathbf{y} - \mathbf{x})$ 。根据 prop. 6 可知,  $f(\mathbf{x})$ 为严格凸函数。

## Convex functions

**Proposition 9:** Second-order conditions to determine a strictly convex function

Suppose  $f(\mathbf{x})$  is twice differentiable. If  $\text{dom}f$  is convex and  $\nabla^2 f(\mathbf{x})$  is positive definite for all  $\mathbf{x} \in \text{dom}f$ , then  $f(\mathbf{x})$  is strictly convex

Please note that the above condition is only a sufficient condition for a function being strictly convex but not a necessary condition. In other words, for a strictly convex differentiable function, its Hessian matrix may not be positive definite.

# Convex functions

## Proposition 10:

Suppose that  $f_1(\mathbf{x})$  and  $f_2(\mathbf{x})$  are convex. Then, their pointwise maximum  $f(\mathbf{x})$ , defined by,

$$f(\mathbf{x}) = \max \{f_1(\mathbf{x}), f_2(\mathbf{x})\}$$

with the domain  $\text{dom}f = \text{dom}f_1 \cap \text{dom}f_2$ , is also convex.

设  $f_1(\mathbf{x})$ 、 $f_2(\mathbf{x})$  的定义域分别为  $\text{dom}f_1$ 、 $\text{dom}f_2$ ，因为这两个函数均为凸函数，根据凸函数的定义（Def. 7）可知， $\text{dom}f_1$ 、 $\text{dom}f_2$  均为凸集。 $f(\mathbf{x})$  的定义域  $\text{dom}f$  显然为  $f_1(\mathbf{x})$ 、 $f_2(\mathbf{x})$  定义域的交集，即  $\text{dom}f = \text{dom}f_1 \cap \text{dom}f_2$ 。根据 Prop. 1，凸集的交集依然是凸集，因此  $\text{dom}f$  为凸集。另外， $\forall \mathbf{x}, \mathbf{y} \in \text{dom}f$ ， $\forall \theta \in [0, 1]$  有，

$$\begin{aligned} f(\theta \mathbf{x} + (1 - \theta) \mathbf{y}) &= \max \{f_1(\theta \mathbf{x} + (1 - \theta) \mathbf{y}), f_2(\theta \mathbf{x} + (1 - \theta) \mathbf{y})\} \\ &\leq \max \{\theta f_1(\mathbf{x}) + (1 - \theta) f_1(\mathbf{y}), \theta f_2(\mathbf{x}) + (1 - \theta) f_2(\mathbf{y})\} \\ &\leq \theta \max \{f_1(\mathbf{x}), f_2(\mathbf{x})\} + (1 - \theta) \max \{f_1(\mathbf{y}), f_2(\mathbf{y})\} \\ &= \theta f(\mathbf{x}) + (1 - \theta) f(\mathbf{y}) \end{aligned}$$

综合以上信息可知， $f(\mathbf{x})$  为凸函数。

# Convex functions

## Proposition 11:

Suppose that  $f_1(\mathbf{x})$  and  $f_2(\mathbf{x})$  are concave. Then, their pointwise minimum  $f(\mathbf{x})$ , defined by,

$$f(\mathbf{x}) = \min \{f_1(\mathbf{x}), f_2(\mathbf{x})\}$$

with the domain  $\text{dom} f = \text{dom} f_1 \cap \text{dom} f_2$ , is also concave.

*How to prove?*

# Convex functions

## Proposition 12:

Suppose that  $f_1(\mathbf{x}), f_2(\mathbf{x}), \dots, f_m(\mathbf{x})$  are convex. Then, their nonnegative combination,

$$f(\mathbf{x}) = \omega_1 f_1(\mathbf{x}) + \omega_2 f_2(\mathbf{x}) + \dots + \omega_m f_m(\mathbf{x})$$

where  $\omega_i \geq 0 (i=1, 2, \dots, m)$ , is also convex.

证明:

$\text{dom}f = \bigcap_{i=1}^m \text{dom}f_i$ , 由于  $\text{dom}f_i$  是凸集, 则  $\text{dom}f$  是一系列凸集的交集, 根据 Prop. 1,  $\text{dom}f$  为

凸集。另外,  $\forall \mathbf{x}, \mathbf{y} \in \text{dom}f$ ,  $\forall \theta \in [0, 1]$  有,

$$\begin{aligned} f(\theta \mathbf{x} + (1-\theta) \mathbf{y}) &= \sum_{i=1}^m \omega_i f_i(\theta \mathbf{x} + (1-\theta) \mathbf{y}) \\ &\leq \sum_{i=1}^m \omega_i (\theta f_i(\mathbf{x}) + (1-\theta) f_i(\mathbf{y})) = \theta \sum_{i=1}^m \omega_i f_i(\mathbf{x}) + (1-\theta) \sum_{i=1}^m \omega_i f_i(\mathbf{y}) \\ &= \theta f(\mathbf{x}) + (1-\theta) f(\mathbf{y}) \end{aligned}$$

综上,  $f(\mathbf{x})$  为凸函数。

# Convex functions

## Proposition 13:

Suppose that  $f_1(\mathbf{x}), f_2(\mathbf{x}), \dots, f_m(\mathbf{x})$  are concave. Then, their nonnegative combination,

$$f(\mathbf{x}) = \omega_1 f_1(\mathbf{x}) + \omega_2 f_2(\mathbf{x}) + \dots + \omega_m f_m(\mathbf{x})$$

where  $\omega_i \geq 0 (i=1, 2, \dots, m)$ , is also concave.

*How to prove?*

## Convex functions

### Definition 11: Quadratic function

A function  $f(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}$  of the following form,

$$f(\mathbf{x}) = \frac{1}{2} \mathbf{x}^T \mathbf{P} \mathbf{x} + \mathbf{q}^T \mathbf{x} + r \quad (\text{Eq. 2})$$

where  $\mathbf{P} \in \mathbb{R}^{n \times n}$  is a symmetric matrix and  $\mathbf{q} \in \mathbb{R}^{n \times 1}$ , is called a **quadratic function**

It can be verified that the Hessian matrix of  $f(\mathbf{x})$  in Eq. 2 is  $\nabla^2 f(\mathbf{x}) = \mathbf{P}$

According to Prop. 8, if  $\mathbf{P}$  is positive semidefinite,  $f(\mathbf{x})$  is convex

According to Prop. 9, if  $\mathbf{P}$  is positive definite,  $f(\mathbf{x})$  is strictly convex

# Outline

# Optimization problems

## Definition 12: Optimization problem

A general optimization problem is expressed in the following form,

$$\begin{aligned} \mathbf{x}^* &= \arg \min_{\mathbf{x}} f_0(\mathbf{x}) \\ \text{subject to } f_i(\mathbf{x}) &\leq 0, i = 1, \dots, m \\ h_i(\mathbf{x}) &= 0, i = 1, \dots, p \end{aligned}$$

$\mathbf{x} \in \mathbb{R}^{n \times 1}$  is the **optimization variable**,  $\mathbf{x}^*$  is the **optimal solution**;  $f_0(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}$  is the **objective function**

$f_i(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}, i = 1, \dots, m$  are the **inequality constraint functions**

$h_i(\mathbf{x}): \mathbb{R}^n \rightarrow \mathbb{R}, i = 1, \dots, p$  are the **equality constraint functions**

If  $m=p=0$ , we say the problem is **unconstrained**

The set of points for which the objective and all constraint functions are defined,

$$\mathcal{D} = \bigcap_{i=0}^m \text{dom} f_i \cap \bigcap_{i=1}^p \text{dom} h_i$$

is called the **domain** of the optimization problem Def. 12.

# Optimization problems

For a point  $\mathbf{x} \in \mathcal{D}$ , if it satisfies all the constraints  $f_i(\mathbf{x}) \leq 0, i = 1, \dots, m$  and  $h_i(\mathbf{x}) = 0, i = 1, \dots, p$ , we say  $\mathbf{x}$  is a **feasible point**.

If there exists at least one feasible point, we say the problem Def. 12 is **feasible**, otherwise it is **infeasible**.

The set of all feasible points is called the **feasible set**.

If the optimal solution  $\mathbf{x}^*$  exists, it should be in the feasible set

The **optimal value** of the problem Def. 12 is defined as,

$$v^* = \min \{ f_0(\mathbf{x}) \mid f_i(\mathbf{x}) \leq 0, i = 1, \dots, m, h_i(\mathbf{x}) = 0, i = 1, \dots, p \}$$

It can be easily known that,

$$v^* = \begin{cases} f_0(\mathbf{x}^*), & \text{if the optimal solution } \mathbf{x}^* \text{ exists} \\ +\infty, & \text{if the problem Def. 12 is infeasible} \\ -\infty, & \text{if the problem Def. 12 is unbounded below} \end{cases}$$

# Optimization problems

---

It needs to be noted that even if the feasible set is not empty, the optimal solution of the problem Def. 12 may not exist

Example:

$$\begin{aligned} x^* &= \arg \min_x 2x \\ \text{subject to } x &\leq 0 \end{aligned}$$

The feasible set of this problem is not empty, but the objective function is unbounded below and thus the optimal solution does not exist.

## Convex optimization problems

### Definition 13: Convex optimization problem

We call the following optimization problem the convex optimization problem,

$$\mathbf{x}^* = \arg \min_{\mathbf{x}} f_0(\mathbf{x})$$

$$\text{subject to } f_i(\mathbf{x}) \leq 0, i = 1, \dots, m$$

$$\mathbf{a}_i^T \mathbf{x} - b_i = 0, i = 1, \dots, p$$

where  $f_i(\mathbf{x})$  ( $i=0,1,\dots,m$ ) is convex

Please make a comparison between the definitions of the general optimization problem and the convex optimization problem

### Proposition 14:

The feasible set of a convex optimization problem is convex.

# Convex optimization problems

As an example, the convex quadratic program is a typical convex optimization problem

## **Definition 14:** Convex quadratic program problem

The convex quadratic program problem is expressed by,

$$\mathbf{x}^* = \arg \min_{\mathbf{x}} \frac{1}{2} \mathbf{x}^T \mathbf{P} \mathbf{x} + \mathbf{q}^T \mathbf{x} + r$$

subject to  $\mathbf{G} \mathbf{x} \leq \mathbf{h}, \mathbf{G} \in \mathbb{R}^{m \times n}$

$$\mathbf{A} \mathbf{x} = \mathbf{b}, \mathbf{A} \in \mathbb{R}^{p \times n}$$

where  $\mathbf{P} \in \mathbb{R}^{n \times n}$  is positive semidefinite

*Can you verify it is really a  
convex optimization problem?*

# Duality

## Definition 15: Lagrangian

We define the Lagrangian  $l(\mathbf{x}, \boldsymbol{\alpha}, \boldsymbol{\beta}) : \mathbb{R}^n \times \mathbb{R}^m \times \mathbb{R}^p \rightarrow \mathbb{R}$  associated with the problem Def. 12 as,

$$l(\mathbf{x}, \boldsymbol{\alpha}, \boldsymbol{\beta}) = f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i h_i(\mathbf{x})$$

where  $\boldsymbol{\alpha} = \{\alpha_i\}_{i=1}^m$ ,  $\boldsymbol{\beta} = \{\beta_i\}_{i=1}^p$  are **dual variables**, and  $\text{dom} l = \mathcal{D} \times \mathbb{R}^m \times \mathbb{R}^p$

## Definition 16: Lagrange dual function

We define the Lagrange dual function  $g(\boldsymbol{\alpha}, \boldsymbol{\beta}) : \mathbb{R}^m \times \mathbb{R}^p \rightarrow \mathbb{R}$  of the problem Def. 12 as the minimum value of its Lagrangian over  $\mathbf{x}$ ,

$$g(\boldsymbol{\alpha}, \boldsymbol{\beta}) = \min_{\mathbf{x} \in \mathcal{D}} l(\mathbf{x}, \boldsymbol{\alpha}, \boldsymbol{\beta}) = \min_{\mathbf{x} \in \mathcal{D}} \left( f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i h_i(\mathbf{x}) \right)$$

# Duality

## Proposition 15:

The Lagrange dual function is concave.

证明:

Def. 16 所定义的对偶函数  $g(\alpha, \beta)$  可变形为如下形式,

$$g(\alpha, \beta) = \min_{\mathbf{x} \in \mathcal{D}} \left( f_1(\mathbf{x}) f_2(\mathbf{x}) \cdots f_m(\mathbf{x}) h_1(\mathbf{x}) h_2(\mathbf{x}) \cdots h_p(\mathbf{x}) \begin{pmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \\ \alpha_m \\ \beta_1 \\ \beta_2 \\ \vdots \\ \beta_p \end{pmatrix} + f_0(\mathbf{x}) \right)$$

显然,  $g(\alpha, \beta)$  为一系列关于  $\begin{pmatrix} \alpha \\ \beta \end{pmatrix}$  的仿射函数逐点求最小得到的; 而根据 Prop. 4, 仿射函数为凹函数。这也就是说, 函数  $g(\alpha, \beta)$  为一系列关于  $\begin{pmatrix} \alpha \\ \beta \end{pmatrix}$  的凹函数逐点求最小而得到的, 根据 Prop. 11 可知,  $g(\alpha, \beta)$  为凹函数。

# Duality

## Proposition 16:

The Lagrange dual function yields lower bounds on the optimal value  $v^*$  of the problem Def. 12, i.e.,

For any  $\alpha \geq 0$  and any  $\beta$ ,  $g(\alpha, \beta) \leq v^*$

先考虑优化问题 Def. 12 可行的情况。假设  $\tilde{\mathbf{x}}$  是优化问题 Def. 12 一个可行点，根据可行点的定义可知，

$$f_i(\tilde{\mathbf{x}}) \leq 0, i = 1, 2, \dots, m, \quad h_i(\tilde{\mathbf{x}}) = 0, i = 1, 2, \dots, p$$

则有，

$$\sum_{i=1}^m \alpha_i f_i(\tilde{\mathbf{x}}) + \sum_{i=1}^m \beta_i h_i(\tilde{\mathbf{x}}) \leq 0,$$

因此，

$$l(\tilde{\mathbf{x}}, \alpha, \beta) = f_0(\tilde{\mathbf{x}}) + \sum_{i=1}^m \alpha_i f_i(\tilde{\mathbf{x}}) + \sum_{i=1}^m \beta_i h_i(\tilde{\mathbf{x}}) \leq f_0(\tilde{\mathbf{x}}),$$

因此，

$$g(\alpha, \beta) = \min_{\mathbf{x} \in \mathcal{D}} l(\mathbf{x}, \alpha, \beta) \leq l(\tilde{\mathbf{x}}, \alpha, \beta) \leq f_0(\tilde{\mathbf{x}})$$

由于上式对任意的可行点  $\tilde{\mathbf{x}}$  都成立，而优化问题 Def. 12 最优值  $v^*$  当然也是在某个可行点处取得的，因此有  $g(\alpha, \beta) \leq v^*$ 。

再先考虑优化问题 Def. 12 不可行的情况。若优化问题 Def. 12 不可行，则其最优值  $v^* = +\infty$ ，则显然有  $g(\alpha, \beta) \leq v^*$ 。

# Duality

Based on Prop. 16, we know that the Lagrange dual function  $g(\alpha, \beta)$  yields the lower bounds for the optimal value of the problem Def. 12. Among these lower bounds, the largest one is the most valuable.

*That motivates us to solve the following Lagrange dual problem*

**Definition 17:** Lagrange dual problem

$$\begin{aligned} \alpha^*, \beta^* &= \arg \max_{\alpha, \beta} g(\alpha, \beta) \\ \text{subject to } \alpha &\geq 0 \end{aligned}$$

The above problem is called the **Lagrange dual problem** of the problem Def. 12, and accordingly, the problem Def. 12 is called the **primal problem**

We say a pair of dual variables  $(\alpha, \beta)$  is dual feasible if they satisfy  $\alpha \geq 0$  and  $g(\alpha, \beta) > -\infty$

It should be noted that no matter whether the primal problem Def. 12 is a convex optimization problem or not, its dual problem Def. 17 is a convex optimization problem!

# Duality

## Proposition 17: Weak duality

The general optimization problems (Def. 12) have the following **weak duality** property.  
The optimal value of the dual problem is,

$$d^* = \max_{\alpha, \beta} g(\alpha, \beta), \text{ subject to } \alpha \geq 0$$

The optimal value of the primal problem (Def. 12) is,

$$v^* = \min \{ f_0(\mathbf{x}) \mid f_i(\mathbf{x}) \leq 0, i = 1, \dots, m, h_i(\mathbf{x}) = 0, i = 1, \dots, p \}$$

Based on Prop. 16, it can be known that  $d^* \leq v^*$

## Definition 18: Strong duality

For an optimization problem, if its optimal value is strictly equal to the optimal value of its dual problem, i.e.,

$$d^* = v^*$$

we say this optimization problem has the property of **strong duality**

What are the conditions an optimization problem needs to satisfy to have strong duality?

# Duality

## Proposition 18: Slater condition

Suppose that the primal problem is convex, i.e., of the form,

$$\mathbf{x}^* = \arg \min_{\mathbf{x}} f_0(\mathbf{x})$$

$$\text{subject to } f_i(\mathbf{x}) \leq 0, i = 1, \dots, m$$

$$\mathbf{Ax} = \mathbf{b}, \mathbf{A} \in \mathbb{R}^{p \times n}$$

where  $f_i(\mathbf{x})$  ( $i=0,1,\dots,m$ ) is convex. If there exists an  $\mathbf{x} \in \text{rel int } \mathcal{D}$  such that,

$$f_i(\mathbf{x}) < 0, i = 1, \dots, m, \mathbf{Ax} = \mathbf{b} \quad (\mathbf{x} \text{ is strictly feasible})$$

Then, such a primal problem has strong duality.

## Proposition 19: Refined Slater condition

For a convex optimization problem, if the first  $k$  constraint functions  $f_1, f_2, \dots, f_k$  are affine, the strong duality holds provided the following weaker conditions: there is an  $\mathbf{x} \in \text{rel int } \mathcal{D}$  with

$$f_i(\mathbf{x}) \leq 0, i = 1, \dots, k, f_i(\mathbf{x}) < 0, i = k + 1, \dots, m, \mathbf{Ax} = \mathbf{b}$$

# Duality

**Proposition 20:** Slater conditions for a convex problem whose constraint functions are all affine

If the primal problem is convex, all its constraints (both the equality constraints and the inequality constraints) are affine, and  $\text{dom}f_0$  is open, then the Slater condition reduces to feasibility. In other words, under such conditions, if the primal problem is feasible, it should satisfy the Slater condition and has strong duality.

证明:

根据已知条件, 该凸优化问题的不等式约束函数  $f_1, f_2, \dots, f_m$  都为仿射函数, 等式约束函数为仿射函数  $A\mathbf{x}=\mathbf{b}$ 。仿射函数的定义域均为  $\mathbb{R}^n$ 。这样, 该优化问题的定义域  $\mathcal{D}$  为  $\text{dom}f_0$  与所有约束函数定义域的交集, 则  $\mathcal{D}=\text{dom}f_0 \cap \mathbb{R}^n \cap \mathbb{R}^n \cdots \cap \mathbb{R}^n = \text{dom}f_0$ , 而  $\text{dom}f_0$  又是开集, 则  $\mathcal{D}$  为  $\mathbb{R}^n$  中的开集, 再由开集的定义 Def. 4 可知,  $\text{int}\mathcal{D}=\mathcal{D}$ 。另一方面, 由于  $\mathcal{D}$  为  $\mathbb{R}^n$  中的开集, 则  $\text{aff}\mathcal{D}=\mathbb{R}^n$ , 则进一步由 Prop. 2 可知,  $\text{relint}\mathcal{D}=\text{int}\mathcal{D}$ 。则有  $\text{relint}\mathcal{D}=\mathcal{D}$ 。若该问题可行, 则说明至少有一点  $\mathbf{x} \in \mathcal{D}=\text{relint}\mathcal{D}$  满足所有约束条件, 即,

$$f_i(\mathbf{x}) \leq 0, i=1, \dots, m, A\mathbf{x}=\mathbf{b}$$

根据 Prop. 19 可知, 该凸优化问题满足修正斯莱特条件, 因此它具有强对偶性。

# Duality

## Definition 19: Duality gap

Suppose that  $\mathbf{x}$  and  $(\alpha, \beta)$  are primal feasible and dual feasible, respectively. The duality gap associated with  $\mathbf{x}$  and  $(\alpha, \beta)$  is defined as,

$$f_0(\mathbf{x}) - g(\alpha, \beta)$$

## Proposition 21:

Suppose that  $\mathbf{x}^*$  and  $(\alpha^*, \beta^*)$  are primal feasible and dual feasible respectively. If the duality gap associated with them is 0, i.e.,

$$f_0(\mathbf{x}^*) - g(\alpha^*, \beta^*) = 0$$

Then,  $\mathbf{x}^*$  and  $(\alpha^*, \beta^*)$  should be primal optimal and dual optimal, respectively, and the primal problem has strong duality

# Duality

Suppose that an optimization problem (the primal problem) has strong duality. If  $\mathbf{x}^*$  is the optimal solution for the primal problem and  $(\alpha^*, \beta^*)$  is the optimal solution for the dual problem, then we have,

$$\begin{aligned} f_0(\mathbf{x}^*) &= g(\alpha^*, \beta^*) \\ &= \min_{\mathbf{x}} \left( f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i^* f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i^* h_i(\mathbf{x}) \right) \\ &\leq f_0(\mathbf{x}^*) + \sum_{i=1}^m \alpha_i^* f_i(\mathbf{x}^*) + \sum_{i=1}^p \beta_i^* h_i(\mathbf{x}^*) \\ &\leq f_0(\mathbf{x}^*) \end{aligned}$$

$$\begin{aligned} f_0(\mathbf{x}^*) &= g(\alpha^*, \beta^*) \\ &= \min_{\mathbf{x}} \left( f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i^* f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i^* h_i(\mathbf{x}) \right) \\ &= f_0(\mathbf{x}^*) + \sum_{i=1}^m \alpha_i^* f_i(\mathbf{x}^*) + \sum_{i=1}^p \beta_i^* h_i(\mathbf{x}^*) \\ &= f_0(\mathbf{x}^*) \end{aligned}$$

- ①  $\mathbf{x}^*$  is the global minimizer of the Lagrangian  $l(\mathbf{x}; \alpha^*, \beta^*) = f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i^* f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i^* h_i(\mathbf{x})$
- ②  $\alpha_i^* f_i(\mathbf{x}^*) = 0, i = 1, 2, \dots, m \Rightarrow \begin{cases} \alpha_i^* > 0 \Rightarrow f_i(\mathbf{x}^*) = 0 \\ f_i(\mathbf{x}^*) < 0 \Rightarrow \alpha_i^* = 0 \end{cases}$  (Complementary slackness)

# Duality

## Proposition 22: KKT conditions for general optimization problems

Suppose that  $f_0, f_1, \dots, f_m, h_1, h_2, \dots, h_p$  are differentiable and the primal problem has strong duality. If  $\mathbf{x}^*$  and  $(\alpha^*, \beta^*)$  are primal optimal and dual optimal respectively, they satisfy the following so-called **KKT conditions**,

$$f_i(\mathbf{x}^*) \leq 0, i = 1, \dots, m \quad (\text{Eq. 3})$$

$$h_i(\mathbf{x}^*) = 0, i = 1, \dots, p \quad (\text{Eq. 4})$$

$$\alpha_i^* \geq 0, i = 1, \dots, m \quad (\text{Eq. 5})$$

$$\alpha_i^* f_i(\mathbf{x}^*) = 0, i = 1, \dots, m \quad (\text{Eq. 6})$$

$$\nabla_{\mathbf{x}=\mathbf{x}^*} f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_i^* \nabla_{\mathbf{x}=\mathbf{x}^*} f_i(\mathbf{x}) + \sum_{i=1}^p \beta_i^* \nabla_{\mathbf{x}=\mathbf{x}^*} h_i(\mathbf{x}) = \mathbf{0} \quad (\text{Eq. 7})$$

Note: in case of general optimization problem, this is a necessary condition for  $\mathbf{x}^*$  and  $(\alpha^*, \beta^*)$  being primal optimal and dual optimal, respectively, but not a sufficient condition

# Duality

## Proposition 23: KKT conditions for convex optimization problems

Suppose the primal problem is convex, i.e.,  $f_0, f_1, f_2, \dots, f_m$  are convex and  $h_1, h_2, \dots, h_p$  are affine, all its constraint functions and the objective function are differentiable, and the problem satisfies Slater conditions. Then,  $\mathbf{x}_0$  and  $(\alpha_0, \beta_0)$  are primal optimal and dual optimal, respectively, **if and only if** they satisfy KKT conditions,

$$f_i(\mathbf{x}_0) \leq 0, i = 1, \dots, m$$

$$h_i(\mathbf{x}_0) = 0, i = 1, \dots, p$$

$$\alpha_{0i} \geq 0, i = 1, \dots, m$$

$$\alpha_{0i} f_i(\mathbf{x}_0) = 0, i = 1, \dots, m$$

$$\nabla_{\mathbf{x}=\mathbf{x}_0} f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_{0i} \nabla_{\mathbf{x}=\mathbf{x}_0} f_i(\mathbf{x}) + \sum_{i=1}^p \beta_{0i} \nabla_{\mathbf{x}=\mathbf{x}_0} h_i(\mathbf{x}) = \mathbf{0}$$

KKT conditions are a crucial tool for solving convex optimization problems. Many algorithms designed to solve optimization problems essentially aim to find feasible points of the primal problem and feasible points of the dual problem that satisfy the KKT conditions. Especially, when the dual problem is easy to solve, we can first find its optimal solution  $(\alpha^*, \beta^*)$ , and then identify a feasible point  $\mathbf{x}^*$  of the primal problem that satisfies the KKT conditions together with  $(\alpha^*, \beta^*)$ ; in such cases,  $\mathbf{x}^*$  must be an optimal solution of the primal problem.

## Duality

### Proposition 23: KKT conditions for convex optimization problems

证明:

必要性, 即要证明: 如果  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  分别为原问题和对偶问题的最优解, 则它们满足 KKT 条件。由于已知原问题满足斯莱特条件, 则可知原问题具有强对偶性; 又因为  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  分别为原问题和对偶问题的最优解且原问题所有约束函数都可微, 根据 Prop. 22,  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  满足 KKT 条件。

# Duality

## Proposition 23: KKT conditions for convex optimization problems

充分性，即要证明：如果  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  满足 KKT 条件，则它们必然分别是原问题和对偶

问题的最优解。由于  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  满足 KKT 条件，则有，

$$f_i(\mathbf{x}_0) \leq 0, i = 1, \dots, m$$

$$h_i(\mathbf{x}_0) = 0, i = 1, \dots, p$$

$$\alpha_{0i} \geq 0, i = 1, \dots, m$$

$$\alpha_{0i} f_i(\mathbf{x}_0) = 0, i = 1, \dots, m$$

$$\nabla_{\mathbf{x}=\mathbf{x}_0} f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_{0i} \nabla_{\mathbf{x}=\mathbf{x}_0} f_i(\mathbf{x}) + \sum_{i=1}^p \beta_{0i} \nabla_{\mathbf{x}=\mathbf{x}_0} h_i(\mathbf{x}) = \mathbf{0}$$

由于原问题为凸优化问题，则可知  $f_0, f_1, \dots, f_m$  都是凸函数且  $h_1, \dots, h_p$  都为仿射函数（见凸优化问题 Def. 13）。又从 KKT 条件第 3 条知道， $\alpha_{0i} \geq 0$ ，则可知拉格朗日函数，

$$l(\mathbf{x}, \alpha_0, \beta_0) = f_0(\mathbf{x}) + \sum_{i=1}^m \alpha_{0i} f_i(\mathbf{x}) + \sum_{i=1}^p \beta_{0i} h_i(\mathbf{x})$$

为关于  $\mathbf{x}$  的凸函数（证明留作练习请读者完成）；同时，KKT 条件的最后一条表明了函数  $l(\mathbf{x}; \alpha_0, \beta_0)$  在  $\mathbf{x}_0$  处的梯度为 0，因此必有  $\mathbf{x}_0$  为  $l(\mathbf{x}; \alpha_0, \beta_0)$  的最小值点。这样我们便有，

$$g(\alpha_0, \beta_0) = \min_{\mathbf{x}} l(\mathbf{x}, \alpha_0, \beta_0) = l(\mathbf{x}_0, \alpha_0, \beta_0) = f_0(\mathbf{x}_0) + \sum_{i=1}^m \alpha_{0i} f_i(\mathbf{x}_0) + \sum_{i=1}^p \beta_{0i} h_i(\mathbf{x}_0) = f_0(\mathbf{x}_0)$$

其中，最后一个等式应用了  $h_i(\mathbf{x}_0) = 0, \alpha_{0i} f_i(\mathbf{x}_0) = 0$  这两个已知条件（KKT 条件中的第 2、4 条）。这说明在  $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  处，对偶间隔为 0，再根据 Prop. 21 可知， $\mathbf{x}_0$  和  $(\alpha_0, \beta_0)$  分别是原问题的最优解和对偶问题的最优解。

# Duality

**Example:** Consider the following equality constrained convex quadratic program problem,

$$\mathbf{x}^* = \arg \min_{\mathbf{x}} \frac{1}{2} \mathbf{x}^T \mathbf{P} \mathbf{x} + \mathbf{q}^T \mathbf{x} + r$$

subject to  $\mathbf{A} \mathbf{x} = \mathbf{b}, \mathbf{A} \in \mathbb{R}^{p \times n}$

where  $\mathbf{P}$  is positive semidefinite

The Lagrangian is  $l(\mathbf{x}, \boldsymbol{\beta}) = \frac{1}{2} \mathbf{x}^T \mathbf{P} \mathbf{x} + \mathbf{q}^T \mathbf{x} + r + \boldsymbol{\beta}^T (\mathbf{A} \mathbf{x} - \mathbf{b})$

Denote the optimal solution for the primal problem by  $\mathbf{x}^*$ , and the optimal solution for the dual problem by  $\boldsymbol{\beta}^*$

For this specific problem, the last equation in KKT conditions is,  $\nabla_{\mathbf{x}=\mathbf{x}^*} l(\mathbf{x}; \boldsymbol{\beta}^*) = \mathbf{P} \mathbf{x}^* + \mathbf{q} + \mathbf{A}^T \boldsymbol{\beta}^* = \mathbf{0}$

For this specific problem, the 2nd equation in KKT conditions is,  $\mathbf{A} \mathbf{x}^* = \mathbf{b}$

$$\begin{bmatrix} \mathbf{P} & \mathbf{A}^T \\ \mathbf{A} & \mathbf{0} \end{bmatrix} \begin{bmatrix} \mathbf{x}^* \\ \boldsymbol{\beta}^* \end{bmatrix} = \begin{bmatrix} -\mathbf{q} \\ \mathbf{b} \end{bmatrix}$$

By solving the above linear equation system, we can get both the primal optimal and dual optimal solutions

# Duality

---

**Example:**

$$x_1, x_2 = \arg \min_{x_1, x_2} x_1^2 + x_2^2$$

subject to  $x_2 \leq b$

$$x_1 + x_2 = 1$$

Please refer to the textbook for the solution
